

InterLine

This print program handles all your deliveries and returns to and from business and private customers (via Parcel Shop or private Addresses). You can also choose for us to notify your consignee per mail when we have scanned the parcel.

InterLine (former Interline) is a print program with its own interface.

When you create a label, data is transferred easily through **InterLine**. It is possible to run multiple installations at the same time in your network and the data can be stored centrally.

InterLine requires internet access and is always updated with routing information, e.g. postal code per depot, country codes and system updates.

Your advantages

- Your consignee can be notified by mail, when the parcel is scanned at GLS.
- More parcels to the same consignee in one operation.
- Automatic data transfer and update.
- Routing information in the barcode.
- Can be integrated with the ERP system in silent mode.
- Works offline.

You can use **InterLine** in three ways.

Stand Alone

A software solution with interface for creating labels. The only requirement is installation of the program and a label printer, and you are ready to print labels.

It is easy to create a customer database, and you can see sent parcels and use Track & Trace directly in the program.

Half silent mode

Automatic import of data from ERP system when you create the order. The order will be completed in **InterLine**, and the label is printed.

Full silent mode

All consignee data is transferred from the ERP system to **InterLine** and the label is printed automatically.

GLS can submit technical specifications and setup to half silent mode or full silent mode.

If you have any questions, please contact our IT department at interline@glg-denmark.com or by phone 76 33 12 35.
